

Work With Water

Project Profile

Water adds variety to a landscape and further enhances its quality. Reflections in water attract the eye and help create a contrast and focal point in the landscape. This pond is visible from inside the home and patio.

This pond is visible from inside the home and patio. The design located the pond so that the major sight line crosses the longest dimension of water surface. The addition of a custom built footbridge spans the pool and connects a walk to smaller pond side terrace.

The design also located the pond so that some existing trees remained along part of the “shoreline”. The trees add interest by casting reflections on the water, provide shade on summer days, and help to blend the pond into the surrounding landscape. At the same time, the irregular shape complemented its surroundings.
